

Milestone 1 Scope, First-Person Mars Geological Sampling Game

Client: Brendan Verwey **Developer:** Mukkaram Saeed **Fixed price:** \$55 **Duration:** 7 days from the date the milestone is funded **Engine:** Unity, URP **Target:** Android phone (mid-range) **Output:** APK + project files

Goal of this milestone: a self-contained, playable level that proves the core loop works on a phone. Function over polish, as agreed. Blockout art and stock props.

In scope

1. First-person mobile controller: touch look, movement, interact.
2. Blockout Mars scene: low-poly sculpted terrain, instanced rock fields, baked lighting, distance fog and horizon backdrop so it reads expansive while staying inside a mobile perf budget.
3. Sampling: pick up rocks. Three rock types with placeholder textures and hidden properties.
4. Lab scanner UI: scan a sample, get informational feedback on whether it was the right choice and why. No fail state.
5. Two scripted judgment cases, not random outcomes:
 - Bag-fit: rock is too big for the bag, player chooses a larger bag or breaks it into pieces.
 - Novelty bias: a shiny outlier tempts the player, the representative rock is the correct scientific pick.
6. Tablet checklist driving the level: confirm numbered bags, log and verify each site, enforce minimum spacing, collect 10 samples plus 1 duplicate at site 10 (11 total), lay all 11 out to verify, bag and label, load the vehicle, send shipment confirmation as the end state.
7. Good Luck: scripted dialogue only, including the satellite locator exchange where the reported distance is wrong and the player can catch it against the spacing rule.
8. Optimisation pass, profiled on a real mid-range Android device, not in the editor.

9. Clean, commented Unity project so mechanics can be expanded later.

Deliverables

- Installable Android APK.
- Unity project files, organised and commented.
- Short readme covering how rock types, scanner cases, checklist steps and dialogue are configured, so new levels and cases can be added without rework.

Acceptance criteria

- Level is playable start to finish on a phone: 11 samples collected, both judgment cases trigger, checklist completes, confirmation end state fires.
- Stable framerate on a mid-range Android device.
- No crashes or blockers in the loop.

Not in this milestone

Environmental hazards (weather events, background aliens, Good Luck disturbing samples). Final or photoreal art, custom characters, animation, audio and voice over. Good Luck AI behaviour or pathing. Map or marker UI. Portals, level loading, shared terrain tooling, save system. iOS build or store submission. More than three rock types, or judgment cases beyond the two listed above. All of these can be quoted as later milestones.

Assumptions

- Blockout geometry, free or stock props, placeholder textures and placeholder audio.
- If you want specific stock packs used, you purchase them or send the links.
- I draft the dialogue lines, you review. One round of text edits included.
- One round of revisions on this milestone. New features move to milestone 2.

Open question

The 11th duplicate sample: separate scan and judge case, or a bagging and labelling step only? I will build it as a bagging and labelling step unless you say otherwise.

Day plan

Day	Work
1	FPS touch controller, blocked out scene, perf budget locked
2	Sample data model, rock pickup, bag-fit case
3	Scanner, novelty bias case, informational feedback
4	Tablet checklist, numbering, spacing rule, 10 + 1 duplicate tracking
5	Good Luck dialogue, satellite locator exchange with the 5,000 km catch
6	Lay-out check, bag and label, load vehicle, confirmation end state
7	Optimisation pass, on-device testing, APK delivery

Anything not listed under "In scope" is out of this milestone by default. If you want something added, tell me before day 3 and I will price it as a separate milestone rather than silently absorbing it.
